Learning Stata

Problem set 1.2

Marc Sangnier & Roberta Ziparo

To do

1. Download the municipality-level vote results of the 2017 French Presidential election from `https://www.data.gouv.fr/fr/datasets/election-presidentielle-des-23-avril-et-7-mai-2017-resultats-du-1er-tour-1/` and `https://www.data.gouv.fr/fr/datasets/election-presidentielle-des-23-avril-et-7-mai-2017-resultats-definitifs-du-2nd-tour-par-communes/`.
2. Construct a Stata data set that gives for each French *département*:
   - Number of registered voters and turnout at each round.
   - Macron and Le Pen vote shares at round 2.
   - Change in turnout between the two rounds.
3. Answer the following questions:
   a) Did the number of registered voters change between the two rounds? If yes, by how much on average?
   b) What are the *départements* in which Le Pen received the 5 highest vote shares?
   c) In which *département* did turnout vary the most between the two round? Which are the 3 *départements* in which turnout varied the less?
   d) What is the national (aggregate) result of the (second round) vote?

Guidelines

- Answers to questions must be given as comments in do-files next to relevant command(s).
- Folders, data and programs must comply with the default directories structure:

  🗀 learning_stata_problem_1
  - 🗀 Data
    - 🗀 Final
    - 🗀 Source
    - 🗀 Temp
  - 🗀 Programs

- Do-files' names must start with a number that indicates their running order.
- Upload your *learning_stata_problem_1* folder (and its content) as a zipped folder named "*stata_problem_1_yourname1[_yourname2].zip*" to the relevant AMeTICE section.
