Learning Stata

Problem set 2

Marc Sangnier & Roberta Ziparo

To do

1. Download data about crimes reported to French police services [*police nationale* (PN) and *gendarmerie nationale* (GN)] between 2012 and 2021 from `https://www.data.gouv.fr/fr/datasets/crimes-et-delits-enregistres-par-les-services-de-gendarmerie-et-de-police-depuis-2012`.

2. Download municipality-level population data from `https://www.insee.fr/fr/statistiques/3698339`.

3. Construct a Stata data set that contains for each crime type, year and *département* : The numbers of crimes reported to PN, the number of crimes reported to GN, and the sum of both.

4. When constructing the data set, make sure that data are consistent across time and space. If not, make justified choices.

5. Restricting the analysis to metropolitan France, answer the following questions:
   a) Which are the 3 departments with the highest total number of crimes that relate to thefts (*vols*)?
   Note: Concealment (*recel*) directly relates to thefts.
   b) Plot the yearly series of theft-related crimes in these 3 départements and in 2 other randomly selected départements.
   c) Which are the 10 départements with the highest average crime rate (i.e., number of all crimes normalized by population)?
   d) Plot the national-level yearly series of all crimes, both in numbers and normalized by population.

Guidelines

- Answers to questions must be given as comments in do-files next to relevant command(s).
- Folders, data and programs must comply with the default directories structure.
- Do-files' names must start with a number that indicates their running order.
- Upload your *learning_stata_problem_2* folder (and its content) as a zipped folder named "*stata_problem_2_yourname1[_yourname2].zip*" to the relevant AMeTICE section.
